

JavaScript Strings

Cheat Sheet

Master full-stack development, one project at a time at thedevspace.io.

There are three ways to create strings in JavaScript: single quotes, double quotes, or backticks for template literals.

```
1 const name1 = "Alice";
2 const name2 = "Bob";
3 const greeting = `Hello, ${name1}`;
```

Measure the length of a string in JavaScript using the `.length` property.

```
1 "Hello".length; // 5
```

Access individual characters in a string using bracket notation or `.charAt()` in JavaScript.

```
1 const str = "JavaScript";
2
3 str[0]; // "J"
4 str.charAt(1); // "a"
```

Find substrings in JavaScript using `.indexOf()` or `.includes()`.

```
1 const str = "JavaScript";  
2  
3 str.indexOf("Script"); // 4  
4 str.includes("Java"); // true
```

Extract parts of a string using `.slice()` or `.substring()` in JavaScript.

```
1 const str = "JavaScript";  
2  
3 str.slice(0, 4); // "Java"  
4 str.substring(4, 10); // "Script"
```

Repeat a string using `.repeat()` to duplicate it a specific number of times in JavaScript.

```
1 "ha".repeat(3); // "hahaha"
```

Replace text in a string using `.replace()` or `.replaceAll()` in JavaScript.

```
1 "apples".replace("a", "A"); // "Apples"
2 "foo bar foo".replaceAll("foo", "baz");
  // "baz bar baz"
```

Trim whitespace from a string using `.trim()`, `.trimStart()`, or `.trimEnd()` in JavaScript.

```
1 "  hello  ".trim(); // "hello"
2 "  hello  ".trimStart(); // "hello  "
3 "  hello  ".trimEnd(); // "  hello"
```

Change the case of a string in JavaScript with `.toUpperCase()` or `.toLowerCase()`.

```
1 "hello".toUpperCase(); // "HELLO"
2 "WORLD".toLowerCase(); // "world"
```

+ Concatenate strings using `+`, `+=`, or template literals with backticks in JavaScript.

```
1 "Hello" + " " + "World"; // "Hello
  World"
2 let msg = "Hi";
3 msg += " there"; // "Hi there"
```

Split a string into an array using `.split()` with a separator in JavaScript.

```
1 "apple,banana,grape".split(","); //
  ["apple", "banana", "grape"]
```

Convert values to strings using `.toString()` or the `String()` function in JavaScript.

```
1 (123).toString(); // "123"
2 String(true); // "true"
```

Use template literals in JavaScript to interpolate variables and expressions.

```
1 const name = "Alice";  
2 `Hello, ${name}!`; // "Hello, Alice!"
```

Match patterns in strings using `.match()` or `.matchAll()` with regular expressions in JavaScript.

```
1 "abc123".match(/\d+/); // ["123"]  
2 [..."ab1c2".matchAll(/\d/g)]; // ["1",  
  "2"]
```

Escape special characters in JavaScript strings using the backslash `\` character.

```
1 const quote = 'He said, "Hi!"\nNew line  
  here.';
```
